

Simple Secrets to Saving Your Vehicle's Transmission

FACT: Every year 13 million automatic transmissions fail in the U.S. mostly due to maintenance neglect.

WHY: The primary cause of transmission failure is oxidized automatic transmission fluid (ATF). Oxidation breaks down the fluid & it loses its protective qualities.

HOW: The heat of today's stop and go driving and smaller, faster-running engines is the major cause of ATF oxidation. This heat & strain causes the fluid to break down faster.

WHEN: No one knows when oxidation will cause ATF to fail completely. There is no test to determine when ATF failure may occur. ATF oxidation will cause transmission failure.

WHAT YOU CAN DO: Traditional transmission fluid changes remove only about 30% of the oxidized ATF. That leaves a whopping 70% of the bad fluid still in your system!. The Walker Tire transmission flush service changes 100% of the oxidized fluid to **save your transmission**
